

ClearPath Recovery

No service case closes until authoritative evidence proves the customer is actually restored

UiPath AgentHack 2026 · Maestro Case · Governed Telecom Recovery

The riskiest case is the one that looks resolved everywhere except the customer's service.

CRM, orders, billing, and support notes can all look green while authoritative service evidence is missing, stale, or contradictory.

Wrongful closure

The customer still has no service, but the case is marked resolved.

Repeat contact

The next call reopens the same work with worse SLA pressure.

Audit gap

Reviewers cannot reconstruct why the case was closed.

The project is not a generic governance platform. It is a concrete telecom exception workflow.

Agents interpret. Policy decides. Maestro routes. Humans own exceptions.

The LLM never closes cases, overrides policy, or mutates production rules.

This is Case work because the route emerges as evidence changes.

The workflow is not a fixed BPMN-style happy path. It is long-running exception handling with changing evidence, SLA pressure, human accountability, and audit requirements.

Unpredictable path

Missing telemetry, stale signals, contradiction, and human review are decided after evidence arrives.

Human-owned risk

High-impact contradictions become reviewer tasks with structured return, not silent automation.

Durable audit

The case must preserve raw agent recommendation, final policy route, reviewer action, and policy versions.

ClearPath Recovery fits Track 1: dynamic exception-heavy casework with agents, automation, and humans in charge at key decision points.

UiPath is the orchestration and governance boundary.

Maestro Case	Dynamic exception-heavy case lifecycle, stage routing, incidents, recovery path.
Action Center	Human task lifecycle, assignment, completion, reviewer action/comment.
Data Fabric / Orchestrator	Durable audit bundle, package/process/version readback, full payload proof.
Test Manager	Manual execution evidence for E-001 through E-009 eval coverage.
UiPath CLI	Repeatable package, task, Data Fabric, Test Manager, and validation readback.

Custom evidence packets make the proof readable; they do not replace UiPath orchestration.

Same green business systems. Missing signal means verify, not close.

closure_candidate -> verify_telemetry

missing_authoritative_signal

UiPath platform role

Maestro Case and Action Center own lifecycle, assignment, completion, and reviewer return. This custom packet is the legible audit/evidence surface because the generated Action Center page hid or mislabeled proof-critical fields during validation.

Reviewer packet

Service recovery verification required: CRM/order/billing/support notes are green, but closure is blocked by missing_authoritative_signal. Do not close until authoritative evidence satisfies policy.

Agent and policy boundary

Raw agent interpretation	Final policy decision		
Event	AIE-E002	Event	PDE-E-002
Recommendation	closure_candidate	Links to	AIE-E002

The agent recommends closure. Policy preserves that recommendation, links it to the final decision, and routes the case to telemetry verification.

- Business state stays green.
- Closure is blocked by missing authoritative service evidence.
- The SLA clock stays alive until telemetry is fresh.

Same green business systems. Contradiction means human review.

Reviewer packet

Service recovery exception review required: CRM/order/billing/support notes are green, but fresh authoritative telemetry contradicts the business state. Do not close; open human exception review.

Block reasonsource_contradiction

Rendering statusstructured_packet_ready

Recommended actions

The business fixture is intentionally the same. Fresh authoritative telemetry says the service is not live, so the route escalates.

- Only the authoritative evidence condition changes.
- Policy rejects closure and opens human review.
- The reviewer sees the contradiction and closure guard.

SERVICE RECOVERY

07

Missing evidence and contradicting evidence are different operational problems.

Missing or stale

Business systems are green
Authoritative telemetry is absent or too old
Allowed route: verify telemetry
Operational posture: controlled retry

Contradicting

Business systems are green
Fresh authoritative telemetry says not live
Allowed route: human review
Operational posture: exception handling

This is the central proof: same business-green fixture, different authoritative signal, different route.

The LLM contributes structured interpretation, not final authority.

Recommendation	closure_candidate	Links to	AIE-LLM-E-003

Reviewer packet

Service recovery ambiguity review required: two valid structured interpretations diverged on the same evidence. Resolve the disagreement and blocked closure checklist before closure.

Block reason	stale_authoritative_signal
Rendering status	structured_packet_ready

Recommended actions

An adversarial interpretation run turns closure pressure and unresolved risk into structured disagreement for policy.

- Advocate and skeptic outputs validate against the same schema.
- Disagreement is policy input, not prose parsing.
- Policy still owns closure eligibility.

The eval suite keeps the agent useful without weakening closure policy.

E-001	Aligned closure accepted
E-002/ E-003	Missing or stale evidence blocks closure
E-004	Source contradiction escalates
E-005/ E-006	Notes and pressure influence routing without overriding truth
E-007/ E-009	Invalid output and override persistence are tested
E-008	Policy improvement remains pending human approval

Validated path: local tests plus Test Manager manual representation, not claimed automated Test Cloud execution.

The strongest product ask is a Maestro Case Human-Review Readiness Check.

The pieces exist across Maestro, Actions, packages, Data Fabric, and Test Manager. Builders need one preflight and auditability contract that proves the human-review path will work before runtime.

Before runtime

Check services, roles, Actions, package/feed version, task bindings, and evidence fields.

During runtime

Expose reviewer field rendering, task lifecycle, and structured return status.

After runtime

Reconstruct agent event, policy decision, human action, versions, and audit payload in one view.

This is framed as actionable product feedback, not a complaint list.

Codex helped build and verify the submission pack.

Built	Python core, schemas, policy engine, evidence packets, audit bundles.
Validated	Unit tests, eval harness, UiPath CLI runbooks, submission sanity check.
Documented	Platform proof map, product feedback, demo storyboard, coding-agent manifest.
Boundary	Codex is build-time assistance, not runtime case authority.

Runtime authority remains: deterministic policy, UiPath orchestration, and human review.

ClearPath Recovery makes agentic service recovery safer without making it toothless.
